

**ADMINISTRATIVE INFORMATION**

1. **Project Name:** Novel Modified Zeolites for Energy-Efficient Hydrocarbon Separations
2. **Lead Organization:** Goodyear Chemical  
1485 E. Archwood Ave, Bldg 132  
Akron, OH 44316-3209
3. **Principal Investigator:** Gary Gray, Goodyear Chemical  
Phone: 330-796-9497; FAX: 330-796-8980  
[gary\\_gray@goodyear.com](mailto:gary_gray@goodyear.com)
4. **Project Partners:**  

Tina M. Nenoff, Sandia National Laboratories Inter-Agency Work Order Material Modification Phone: 505-844-0340; FAX: 505-844-7786 <a href="mailto:tmnenof@sandia.gov">tmnenof@sandia.gov</a>	Richard D. Noble, University of Colorado Phone: 303-492-6100; FAX: 303-492-4637 <a href="mailto:nobler@colorado.edu">nobler@colorado.edu</a>
Thomas M. Anderson, Burns & McDonnell (formerly Nofsinger Process & Industrial Group) In-kind Contribution Process Modeling & Economic Evaluation Phone: 816-822-3275 <a href="mailto:tanders@burnsmcd.com">tanders@burnsmcd.com</a>	
5. **Date Project Initiated:** April 23, 2002
6. **Expected Completion Date:** April 23, 2005

**PROJECT RATIONALE AND STRATEGY****7. Project Objective:**

This project will attempt to develop a new family of inorganic crystalline porous materials under IMF that will lead to improvement of energy efficiency and productivity *via* improved separations. Initially this project will be focused on materials for the separation of linear from branched hydrocarbons. However, it is anticipated that the results will provide the basis of knowledge to enable this technology to be applied toward additional hydrocarbon and chemical separations. Industrial involvement from Goodyear and Burns & McDonnell provides needed direction for solving real industrial problems, which will find application throughout the US chemical and petroleum industries.

**8. Technical Barrier(s) Being Addressed:**

The primary *technical hurdle* in this work is finding the precise combination of zeolite and carbon deposition parameters that will be successful for the separation of *n*-pentane from isoprene, and then *n*-pentane from isoamylenes. Additional potential *hurdles* relate to scale up and industrial usage, such as potential fouling, deactivation, and material regeneration. It is expected that increasingly complex feed-streams are likely to increase fouling and decrease the ability to regenerate the materials, but these will not be known quantities until actual industrial testing is initiated. In the worst-case scenario, however, we

anticipate that these materials can be regenerated and re-used in a similar manner as industrial zeolite catalysts. Fortunately, successful preliminary work has indicated that this separation is possible using differential adsorption on a carbon-modified zeolite. Furthermore, a great deal of groundwork concerning carbon deposition in zeolites has already been performed<sup>1,2,3,4</sup>, allowing us to focus on a relatively small number of variables. Selective desorption can be an issue with some adsorbent materials, and it is recognized in this research that studies will need to be performed regarding this issue. However, based on previous work<sup>1</sup>, these materials will possess significantly different adsorption energies such that both pressure and temperature can be readily used to achieve selective desorption, and therefore successful separations of the hydrocarbons considered in this project.

#### 9. Project Pathway:

A strong team has been assembled to attack the aforementioned technical barriers. The intended pathway includes utilizing University of Colorado's (U. Colo.) strong tubular membrane program and adapting this with carbon modified zeolites prepared by Sandia National Laboratories (SNL). The newly assembled membrane utilizes the strengths from both organizations and will be rigorously tested using actual plant C<sub>5</sub> streams by Goodyear Chemical. Through an iterative fashion, the generated data will be forwarded to Burns & McDonnell for economic process modeling. In addition, a well-known support tube manufacturer (Pall Corporation) has been consulted for commercialization.

#### 10. Critical Technical Metrics:

The success of this project will be based upon the economic process modeling performed by Burns & McDonnell. The criterion for success has already been established by performing a series of ideal separation simulations necessary to obtain the desired energy savings via membrane augmentation. Membrane performance, throughput, lifetime and cost have been factored into the overall project success/failure criteria.

Metrics:

- Baseline isoprene plant separation performance (lbs. steam/ lb. isoprene recovered) has been calculated using conventional distillation.
- A reduction in metric #1 *via* tubular membranes such that it generates a substantial energy savings.
- Membrane throughput, lifetime and cost (initial and annual).

### **PROJECT PLANS AND PROGRESS**

#### 11. Past Accomplishments:

- Modified numerous zeolites (including Y, L, ZSM-5, Beta) by varying cation-loading, surface-modifying temperatures and durations, Si/Al ratios, carbonization levels.
- Modified materials were characterized and evaluated for separations using BET surface analyzer and Temperature Programmed Desorption (TPD) of branched & linear C<sub>5</sub> hydrocarbons. TPD was used to measure the catalytic acid sites and sorptive strengths by NH<sub>3</sub> and pyridine sorption.
- Analytical methods completed for separation/permeation at Goodyear.
- Constructed pilot plant unit at Goodyear (capable of evaluating packed beds, disks, and membrane tubes) and also at SNL for C<sub>5</sub> separation experiments.

<sup>4</sup> P. Andy, D. Martin, M. Guisnet, R.G. Bell, and R.A. Catlow, J. Phys. Chem. B, 104 (2000) 4827.

- Conducted preliminary testing of separation abilities of various carbonized pellet disks and bulk material in Goodyear flow reactor. Pellet disk appears to be too porous and allowing all gases to pass through. Supported zeolite disc and/or tube membranes are necessary for testing.
- Started synthesizing self-supported, titania coated stainless steel-supported and alumina-supported Zeolite Y, ZSM-5 and silicalite membranes. The surface modification of supported membranes ongoing.
- Awarded an increase in FY03 and FY04 funds for this OIT/IMF project. The increase will allow the scope of the project to increase by adding university, an additional industrial partner, and lab-modeling efforts into the project. This will allow for the acceleration of the program to bring modified zeolites to commercialization and implementation.
- Wrote and signed the new Statement of Work between SNL and U. Colo. (Dr. Richard Noble) for OIT/IMF enlarged project. Their primary tasks are to produce zeolite membranes and conduct on-line testing of the membranes and the separation/selectivity process. Intellectual Property rights continue to be worked out between new three-way partnership between SNL, Goodyear and U. Colo.
- Modeling of Zeolite Adsorption Isotherm studies started with Dr. Marcus Martin of SNL to better understand the structure/property relationship of the modified zeolites and their enhanced hydrocarbon selectivity.
- Held review meeting at Sandia, CA in March, 2004 with both Goodyear Executive and Chemical Leadership Teams.
- Held a meeting between SNL (Tina Nenoff) and U. Colo. (Rich Noble) at the American Chemical Society National Meeting, Anaheim, CA, in April, 2004.

## 12. Future Plans:

The major milestones to be accomplished are to:

- Determination of the best zeolite-carbon deposition condition combination *via* C<sub>5</sub> separation experiments and full material characterization.
  - SNL will continue to synthesize the chosen zeolites and their optimized carbonization process for bulk scale studies at various temperatures at both SNL and Goodyear test facilities.
  - U. Colo. will continue to synthesize the zeolite films on a variety of substrates for testing in the pilot plant facility at Goodyear; samples will be provided to SNL for modification and testing, plus pilot testing at Goodyear
- Selection of the best material and the synthesis of sufficient quantity of the best material for the pilot plant testing.
- Analytical support for chemical characterization of the selected materials and materials' lifetime studies.
- Feedback of results to SNL, U. Colo. and Burns & McDonnell.
- Engineering studies and detailed economic calculations on the selected materials.
- Complete detailed computer process modeling simulations.
- Complete detailed economic benefits from adsorption technology.

## 13. Project Changes:

Under the current program there have been no changes in the project direction or timetable.

## 14. Commercialization Potential, Plans, and Activities:

*Commercialization of this technology* relies on the research and development of novel modified zeolite materials for advanced energy efficient separation processes for the petroleum and chemical industries with the help of IMF and future OIT funding. Successful research and development of these materials

and their final commercialization into separation processes is guaranteed with the ensemble of varying skills from this project team. These skills include the industrial separations expertise of Goodyear, the advanced industrial process modeling of Burns & McDonnell, and the research and development expertise of SNL. It is envisioned that the successful completion of this research will position this project team with a future OIT proposal, which will be used to completely develop a commercially viable process. The integration of materials research, process development, and engineering analysis, *via* direct feedback, will streamline commercialization of this technology. *Current and potential collaborating strategies* are inherent to this proposal because each industrial partner has different skill sets. It is expected that during the commercialization stages of an OIT-funded proposal, Pall Corporation will be a new team member. Their contribution in the future OIT proposal will be the adaptation of this technology to membrane based separations, while licensing strategies, economic analysis, and potential market barriers will be addressed by all partners of this future OIT proposal. Finally, the necessary validation to other chemical industries for this technology will be twofold. The economic benefits obtained through the *minimization of energy and waste* under industrial process conditions, will be demonstrated *via* economic modeling by Burns & McDonnell, and the technical feasibility of this will be demonstrated *via* pilot-plant trials by Goodyear. After the completion of this IMF proposal, OIT funding will be sought for material development of process separations relying on pressure swing adsorption and membranes.
